

You've taken an important first step

Making the right decisions for your baby starts with asking the right questions. The following tips and questions should help you talk to your baby's doctor.

Preparing for your next appointment

- ☒ Call your doctor and book an appointment
- ☒ Save or print this guide and bring it with you
- ☒ Consider bringing a family member or friend
- ☒ Request an interpreter if you need one
- ☒ Prepare a short summary of your baby's medical history

Facts to read in the waiting room

-  Respiratory Syncytial Virus (RSV) is common and 2 out of 3 babies get it by age 1
-  RSV is the leading cause of hospitalization in babies under 1
-  RSV is unpredictable—it's hard to know which babies can get it, or how serious it may become

Questions for your baby's doctor

1. Why is it important to protect my baby against RSV?
2. How does a monoclonal antibody like Beyfortus work?
3. Is Beyfortus safe for my baby? Even if they were born premature, have heart disease, or have lung disease?
4. How long does Beyfortus protection last?
5. When should my baby get Beyfortus?

IMPORTANT SAFETY INFORMATION

Your child should not take Beyfortus if your child has a history of serious allergic reactions to nirsevimab-alip or any of the ingredients in Beyfortus.

Before your child receives Beyfortus, tell your healthcare provider about all of your child's medical conditions, including if your child:

- has ever had a reaction to Beyfortus.
- has bleeding or bruising problems. If your child has a problem with bleeding or bruises easily, an injection could cause a problem.

Tell your healthcare provider about all the medicines your child takes, including prescription and over-the-counter medicines, vitamins, and herbal supplements. Your infant should not receive a medicine called palivizumab if they have already received Beyfortus in the same RSV season.

Serious allergic reactions have happened with other medicines like Beyfortus. Get medical help right away if your child has any of the following signs or symptoms of a serious allergic reaction:

- swelling of the face, mouth, or tongue
- difficulty swallowing or breathing
- unresponsiveness
- bluish color of skin, lips, or under fingernails
- muscle weakness
- severe rash, hives, or itching

The most common side effects of Beyfortus include rash and pain, swelling, or hardness at the site of your child's injection. These are not all the possible side effects of Beyfortus. Call your healthcare provider if you have questions about side effects.

INDICATION

Beyfortus is a prescription medicine used to help prevent a serious lung disease caused by Respiratory Syncytial Virus (RSV) in:

- Newborns and babies under 1 year of age born during or entering their first RSV season.
- Children up to 24 months of age who remain at risk of severe RSV disease through their second RSV season.
